DZB Blocking Cylinder

Technical Information

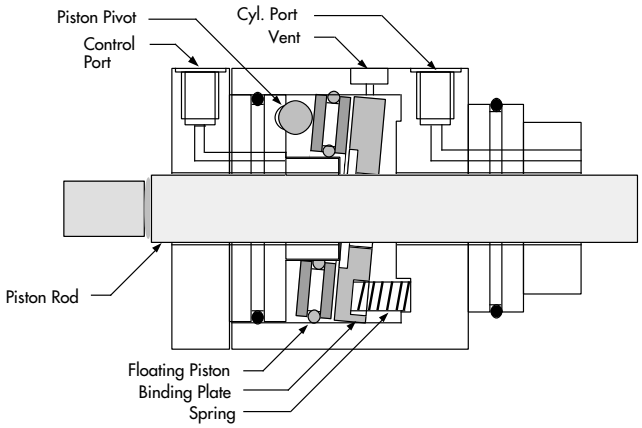
HOW A BLOCKING CYLINDER WORKS:

When pressure is supplied to the Control Port, the Floating Piston pivots on the ball positioning the Binding Plate perpendicular to the piston rod. This action releases the piston rod allowing the rod to move freely.

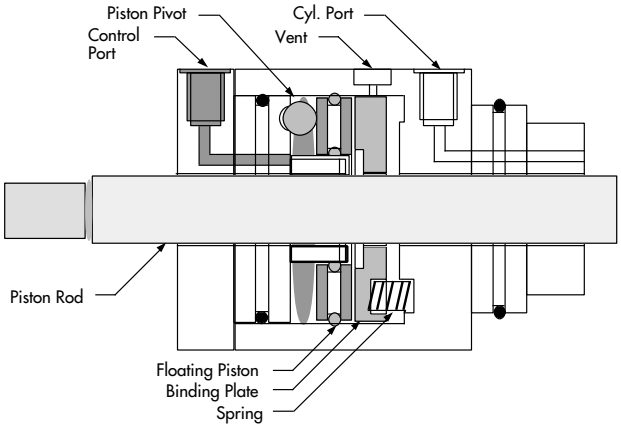
Caution:

1. The piston rod should not be allowed to rotate while in the locked position.
2. The Piston Rod should be stopped before operating the locking mechanism.

DZBA: Extend Lock Control Without Pressure to Control Port



DZBA: Extend Lock Control Pressurized Control Port



TYPICAL INSTALLATIONS

Example 1:

Compressed air from the main supply line is connected to both the valve and the control port of the cylinder. If the main supply pressure is lost, the control port releases the binding plate, locking the cylinder rod. The cylinder stays in this position until the main supply pressure returns to both the valve and the control port.

Example 2:

A 3-Way, Normally Open Valve independently supplies pressure to the control port. When the valve is energized the piston rod moves freely. De-energizing the valve locks the piston rod in position.
